

Abstract

The present invention relates to a liquid polymerizable composition having a polymerizable monomer which contains a substituent which is capable of being converted to an alkene by the action of a base, and a polymerizable monomer which contains a substituent which is capable of being converted to an alkene by the action of a base.

and at least one compound of the formula 12

In which

R¹¹, R¹² and R²¹ are as defined in claim 1,

and the base is chosen so as to effect polymerization based on the ESR or TPS effect.
